Part B: Domain Description

Describe your domain chosen for DV II:
My domain is about musical life in Australia: who sings or plays, and which instruments the country imports. It sits between cultural participation and the trade in musical instruments. The page follows one story from children who play, through age, lessons and live music, to the instruments that arrive from overseas.

Describe the Why and Who aspects of your DV II:
The page is for a general reader in Australia, with no background in music education or trade statistics. The need is to see two facts that are hard to get from the published tables on their own. Playing and singing outside school is a childhood activity, a little less common in 2021-22 than in 2017-18, and the children who still play usually take lessons and practise for a short time. Over the same decade the import bill moved from acoustic pianos to electric guitars and keyboards, shipped from a short list of countries. Putting the survey beside the shipments shows who takes part and what the country buys, without treating a customs record as a count of students.

Describe the "What" aspect of your DV II:
The participation figures come from the Australian Bureau of Statistics, Cultural and creative activities, 2021-22 financial year, released 21 April 2023. That release includes the 2017-18 comparison. The tables used are 4, 9, 13 and 22: children's creative activities by age, the change between the two surveys, lessons and weekly practice among children who sing or play, adult participation by age and sex, and children's attendance at a live music performance by state. "Singing or playing" is one survey question, so the data cannot separate guitar from choir. The adult question is stricter than the child question, and the page says so.

The trade figures come from the United Nations Statistics Division, UN Comtrade, Harmonised System imports reported by Australia, headings 9201-9207, for 2015-2024. These are the most recent years available from each source. Values are in US dollars. Headings were grouped into instrument families, such as acoustic pianos, electric guitars and electric keyboards, so a pair of castanets and a drum kit are compared by value rather than by item count. Coastlines are Natural Earth, through the world-atlas 110m TopoJSON. State outlines are a GeoJSON file with the attendance rates joined on. I didn't invent any figures - the only processing was selecting the published cells, grouping the customs headings, and joining the state rates to the map.

Describe the "How" aspect of your DV II

I chose to answer questions in the story with an idiom each.

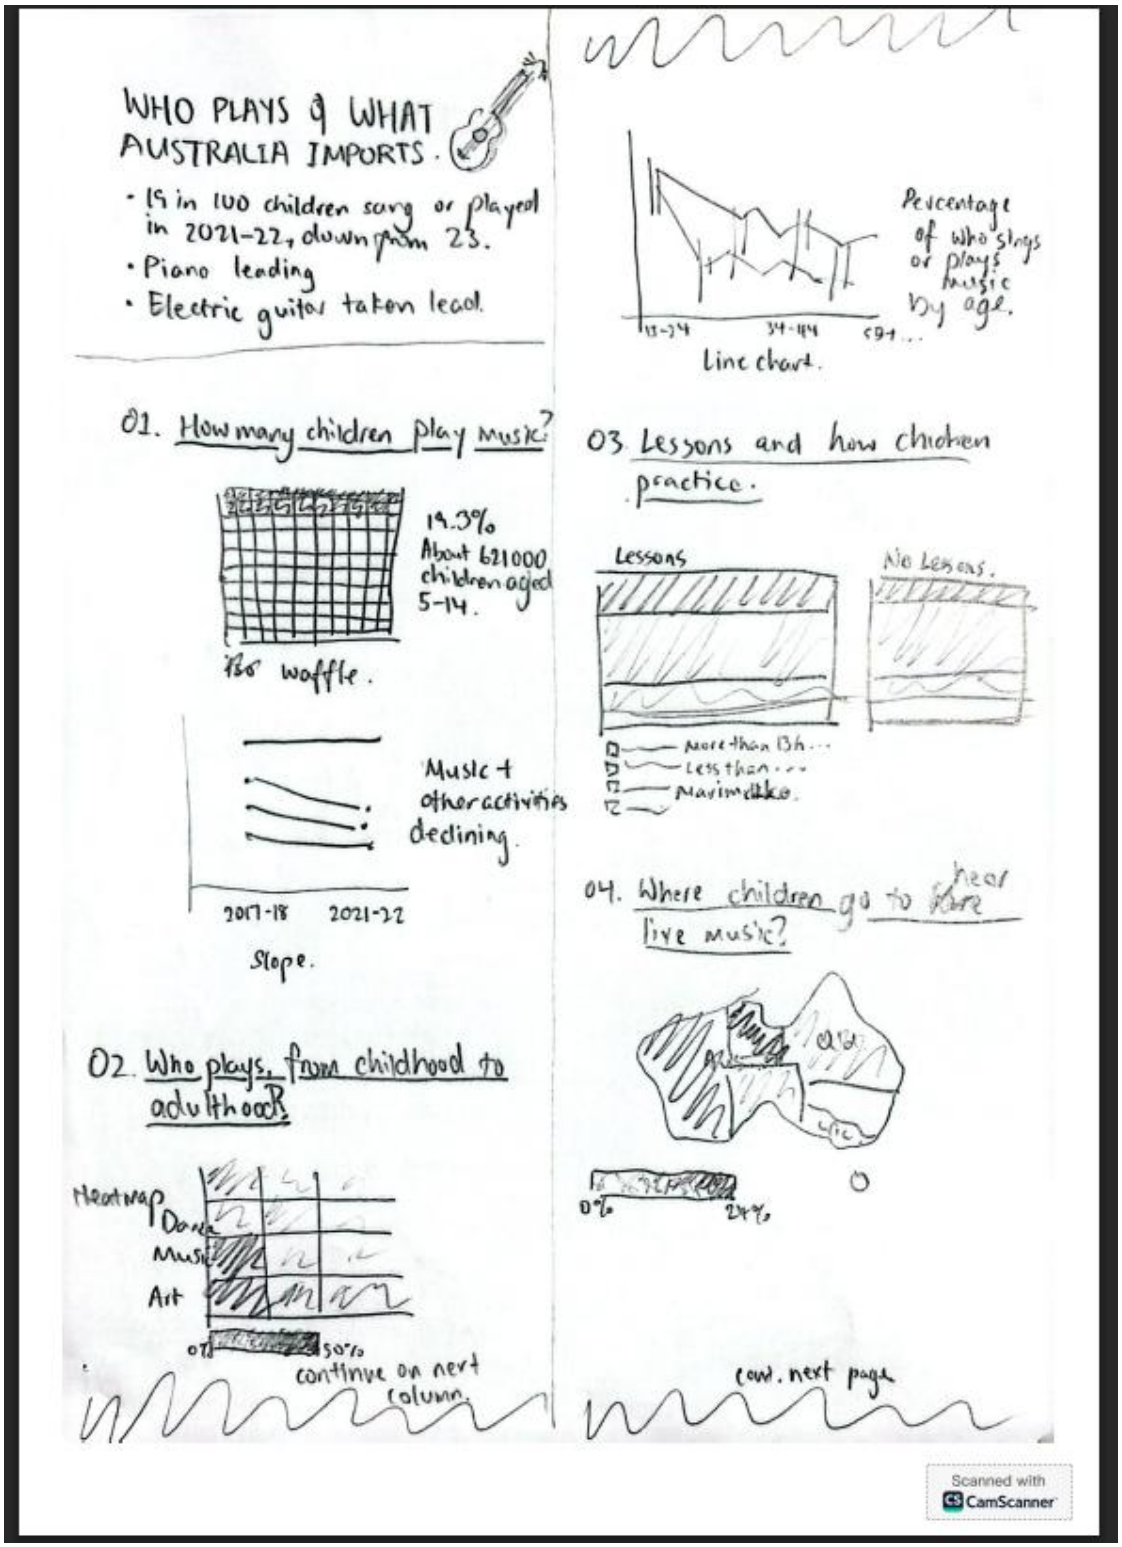

The isotype clearly establishes the 19.3 percent stat (nineteen squares out of one hundred). The slope chart puts singing or playing beside drama, dancing, writing and art and craft, so the fall is read against the other creative activities. The heatmap shows that music rises after ages 5-8 and is still common at 12-14, while craft and dance decline. The line chart follows adults by age, with men and women drawn separately and the margin of error on each point. The Marimekko crosses lessons with weekly practice: column width is the size of the group, and the blocks show that most children, with or without lessons, practise for under two hours.

The three maps use different idioms. The choropleth uses a conic equal-area projection so a rate can be compared across states without stretching Western Australia. The proportional-symbol map uses Equal Earth, centred on the Pacific, so China's value is the circle area rather than the size of the country. The flow map uses the same projection and the same dollar steps, and draws the six large origins as routes into Australia. Colour on those routes is the largest instrument family.

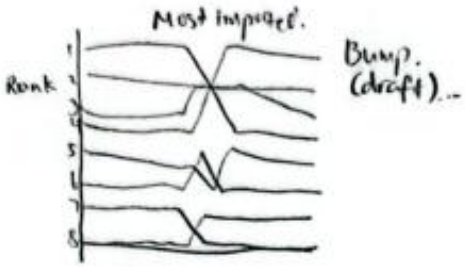

The bump chart shows which family ranked first from 2015 to 2024. The waterfall shows how much of the change in the bill each family accounts for. The treemap shows the 2024 bill as area. The same instrument colours run through these charts and the flow map, so the electric guitar and the piano can be followed from one figure to the next. Hovering shows the published figure and, where the Bureau gives one, the margin of error. Clicking a name on the slope chart isolates that activity.

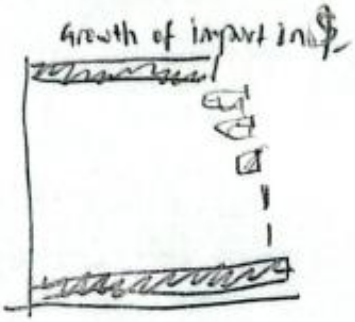

Part C: Sketch

https://liiganghah.github.io/fit3179-dv2/docs/lhah0001-dv2-draft.pdf

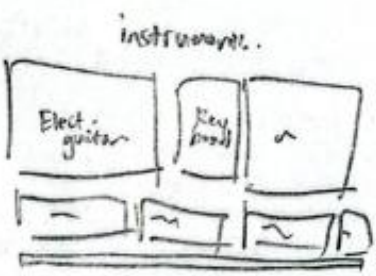

05. Which instruments Aus imports?

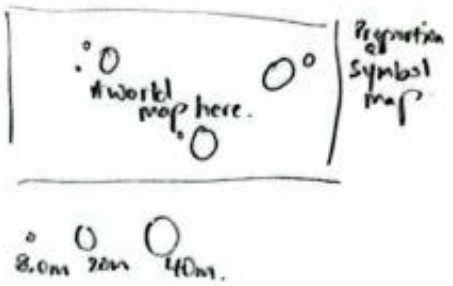

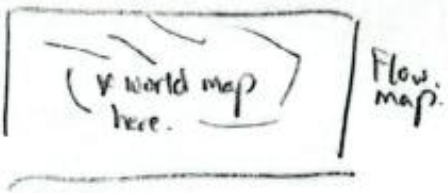

2024 Bill.

06. Which countries those instruments come from?

Electric guitar
Acoustic guitar.
Electric keyboards

8m
20m.
40m

07. What it shows

- Write conclusion here.
- Playing music is a childhood activity
- Less common compared to 4 years before.

Next page.
